# **Stability**

# **Specific Objectives**

>Appreciate the importance of stability

- Analyze different types of stability
- Apply Routh's stability criterion for stability analysis and solve the numerical.

# "Concept of Stability"

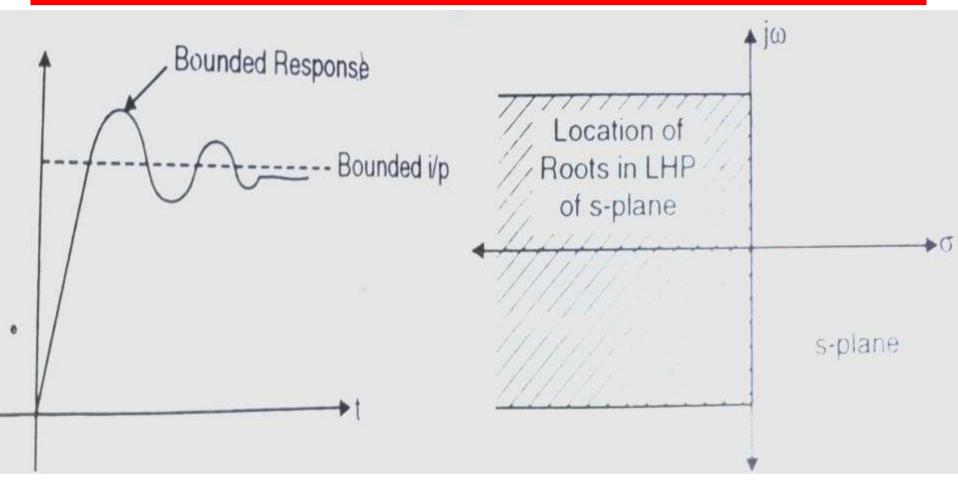

The concept of stability can be illustrated by a cone placed on a plane horizontal surface.

# **Stable System**

A linear time invarient system is stable if following conditions are satisfied:

- A bounded input is given to the system, the response of the system is bounded and controllable.
- ➤ In the absence of the inputs, the output should tend to zero as time increases.

## **Stable System**

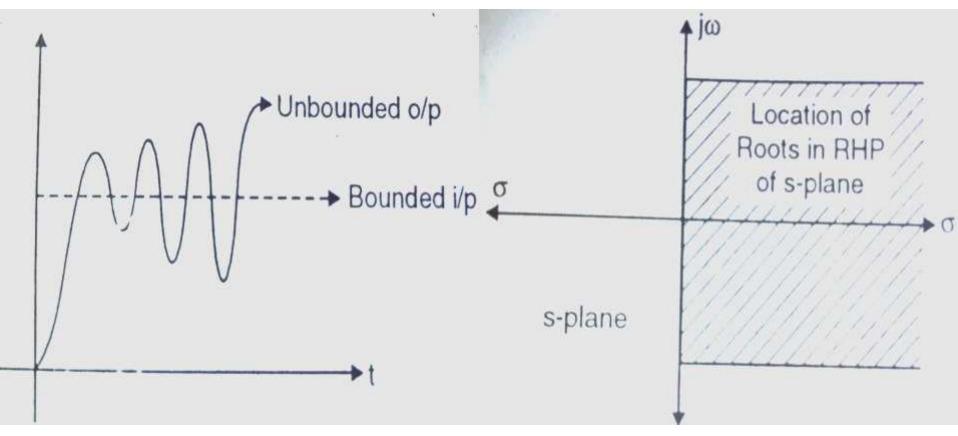

Bounded i/p bounded o/p for stable system

Location of roots for stable system

# **Unstable System**

- A linear time invarient system comes under the class of unstable system if the system is excited by a bounded input, response is unbounded.
- ➤ This means once any input is given system output goes on increasing & designer does not have any control on it

## **Unstable System**

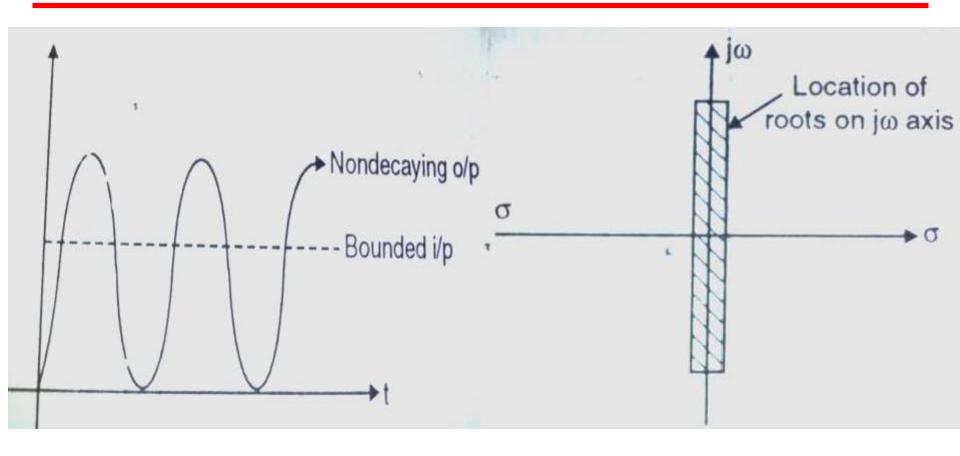

Bounded i/p Unbounded o/p for unstable system

Location of roots for unstable system

# **Critically Stable System**

- ➤ When the input is given to a linear time invarient system, for critically stable systems the output does not go on increasing infinitely nor does it go to zero as time increases.
- The output usually oscillates in a finite range or remains steady at some value.
- Such systems are not stable as their response does not decay to zero. Neither they are defined as unstable because their output does not go on increasing infinitely.

## **Critically stable System**

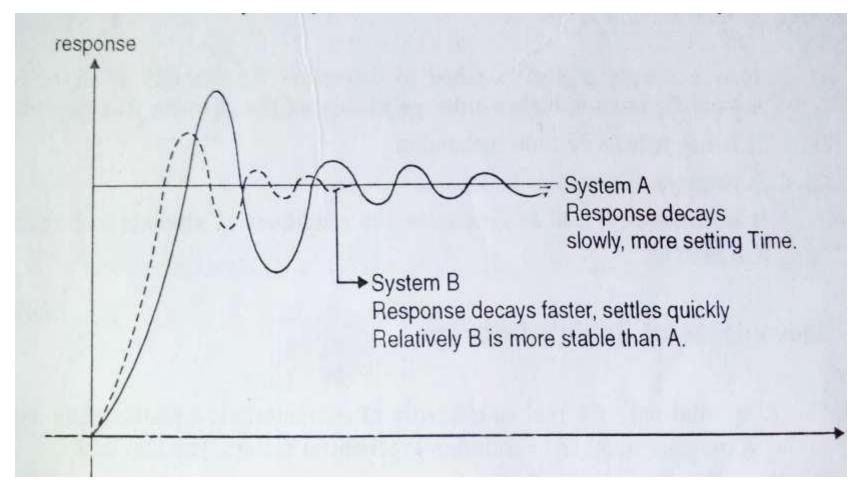

Bounded i/p & o/p response for critically stable system

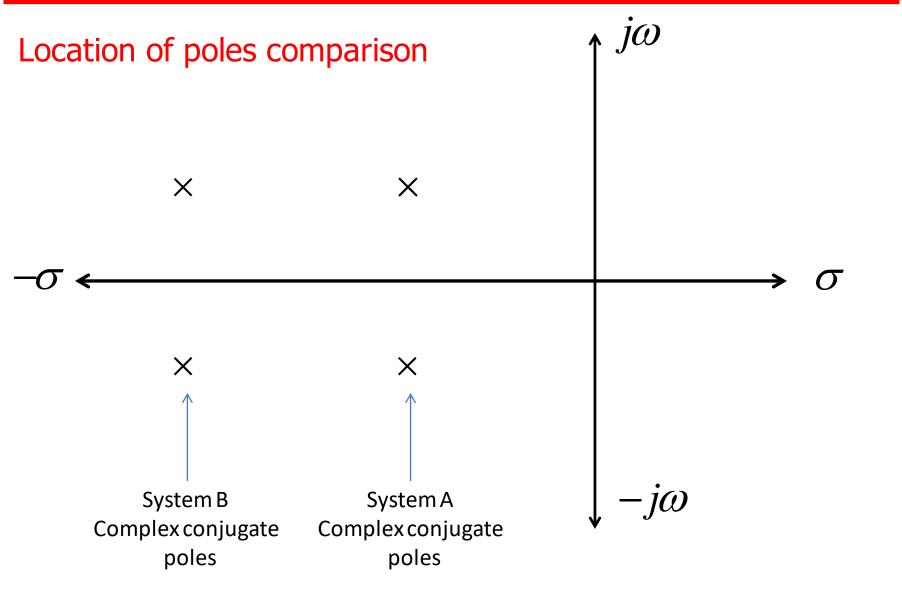

Location of roots for critically stable system

- A system may be absolutely stable i.e. it may have passed the Routh stability test.
- > As a result their response decays to zero under zero input conditions.
- The ratio at which these decay to zero is important to check the concept of "Relative stability"

- ➤ When the poles are located far away from jw axis in LHP of s-plane, the response decays to zero much faster, as compared to the poles close to jw-axis.
- The more the poles are located far away from jw-axis the more is the system relatively stable.

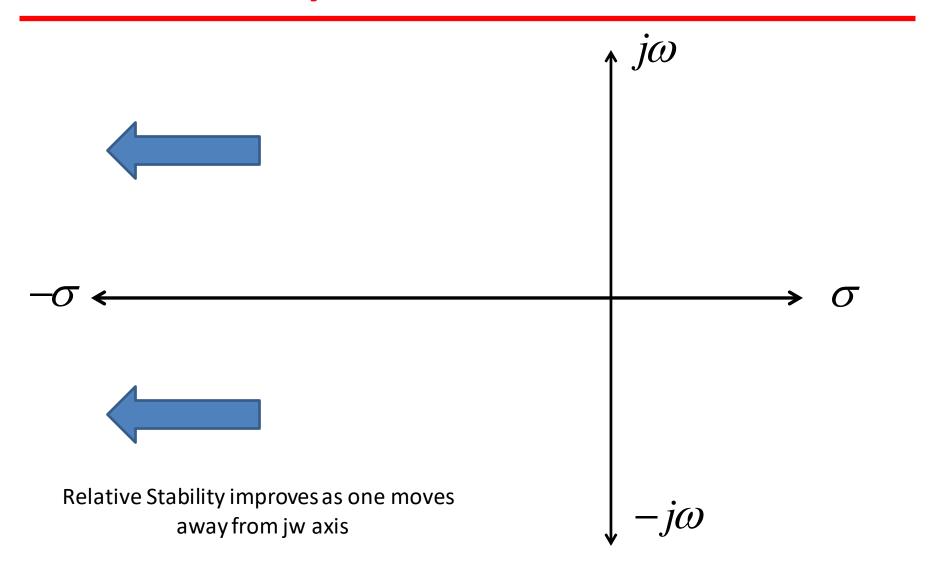

Response comparison

LPU

Dr.Anuj Jain

# **Routh's Stability Criterion**

For the transfer function;

$$\frac{C(s)}{R(s)} = \frac{b_0 s^m + b_1 s^{m-1} + \dots + b_m}{a_0 s^n + a_1 s^{n-1} + \dots + a_n}$$

In this criterion, the coefficients of denominator are arranged in an Array called "Routh's Array";

$$a_0s^n + a_1s^{n-1} + \dots + a_n = 0$$

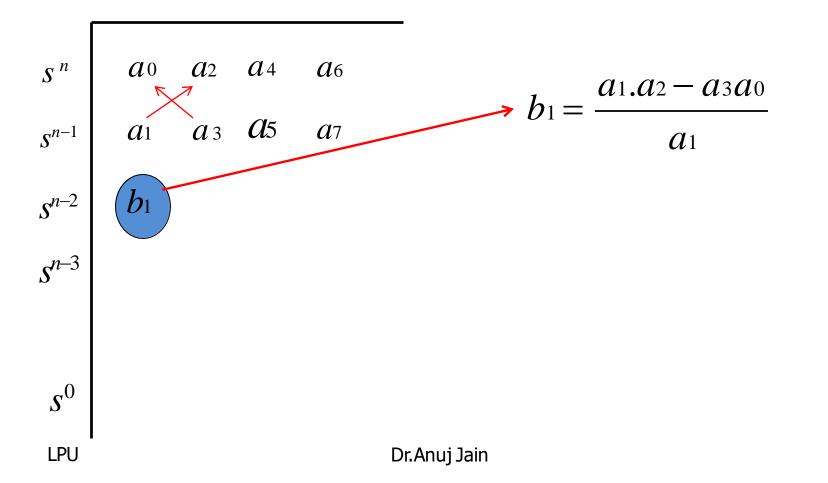

The coefficients of  $s^n$  and  $s^{n-1}$  row are directly written from the given equation.

$$a_0 s^n + a_1 s^{n-1} + \dots + a_n = 0$$

The Routh's array as below;

For next row i.e. 
$$s^{n-2}$$
;

16

The coefficients of  $s^n$  and  $s^{n-1}$  row are directly written from the given equation.

$$a_0 s^n + a_1 s^{n-1} + \dots + a_n = 0$$

The Routh's array as below;

For next row i.e.  $s^{n-2}$ 

$$b_1 = \frac{a_1 \cdot a_2 - a_3 a_0}{a_1}$$

$$b_2 = \frac{a_1.a_4 - a_0.a_5}{a_1}$$

The coefficients of  $s^n$  and  $s^{n-1}$  row are directly written from the given equation.

$$a_0 s^n + a_1 s^{n-1} + \dots + a_n = 0$$

## The Routh's array as below;

For next row i.e.  $s^{n-2}$ 

$$b_1 = \frac{a_1 \cdot a_2 - a_3 a_0}{a_1}$$

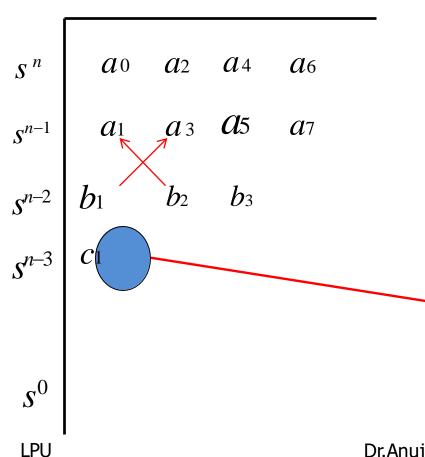

$$b_2 = \frac{a_1 \cdot a_4 - a_{\cdot 0} \cdot a_5}{a_1}$$

$$b_3 = \frac{a_1.a_6 - a_0.a_7}{a_1}$$

LPU

#### Now the same technique is used, for the next row i.e. $s^{n-3}$ row, but only previous two rows are used i.e. $s^{n-1}$ and $s^{n-2}$

#### The Routh's array as below;

For next row i.e.  $s^{n-2}$ 

$$b_1 = \frac{a_1 \cdot a_2 - a_3 a_0}{a_1}$$

$$b_2 = \frac{a_1.a_4 - a_0.a_5}{a_1}$$

$$b_3 = \frac{a_1.a_6 - a_{0.}a_7}{a_1}$$

For next row i.e.  $s^{n-3}$ 

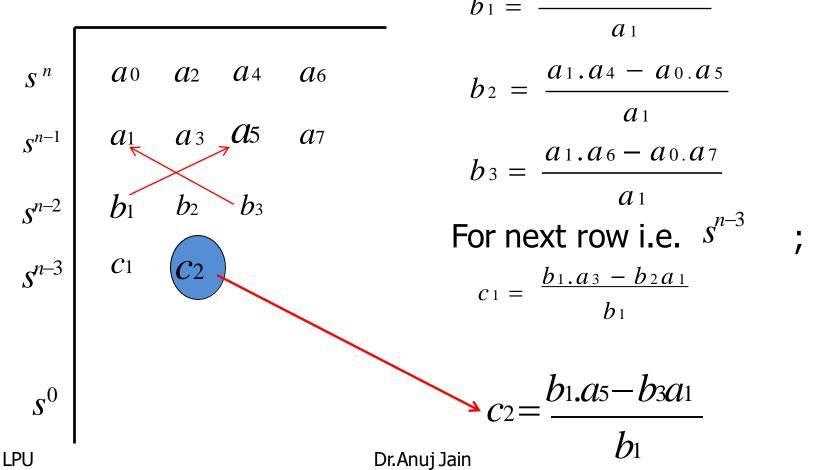

$$c_1 = \frac{b_1.a_3 - b_2a_1}{b_1}$$

Dr.Anuj Jain

# Now the same technique is used, for the next row i.e. $s^{n-3}$ row, but only previous two rows are used i.e. $s^{n-1}$ and $s^{n-2}$

For next row i.e.  $s^{n-2}$ 

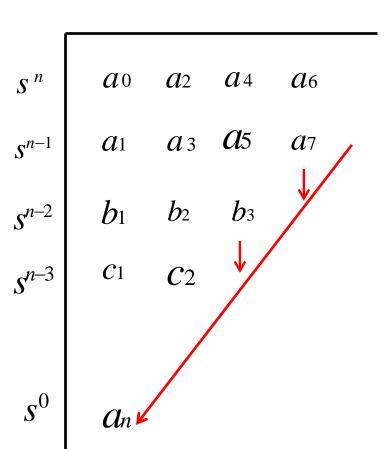

#### The Routh's array as below;

34

Each column will reduce by one as we move down the array.

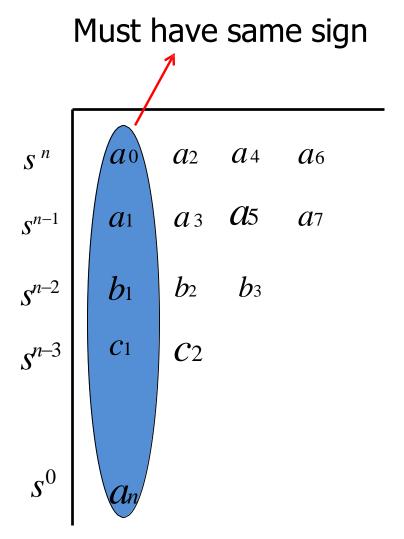

This process is obtained till last row is obtained.

LPU

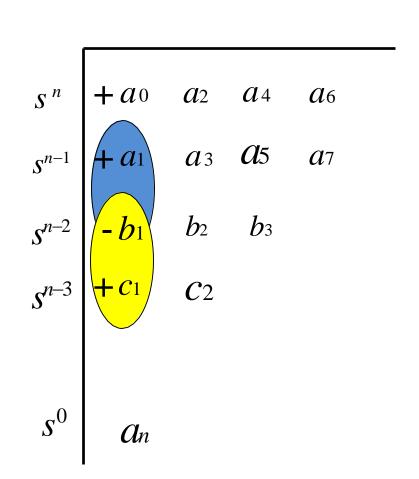

#### Routh's Criterion

- The necessary & sufficient conditions for a system to be stable is all terms in the first column at Routh's Array should have same sign.
- There should not be any sign change in first column.

#### Routh's Criterion

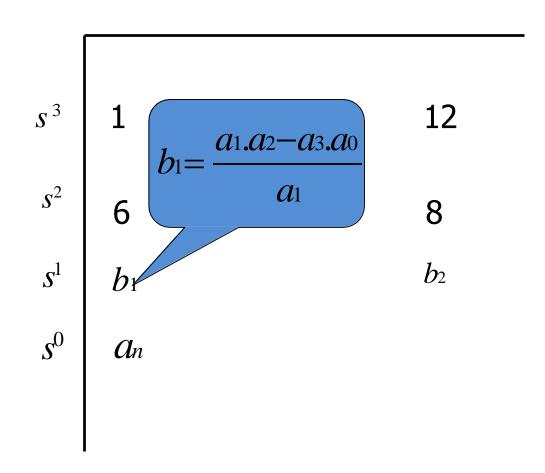

- ➤ When there are sign changes in the first column of Routh's array then the system is unstable.
- > There are roots in RHP.
- The number of sign changes equal the number of roots in RHP.

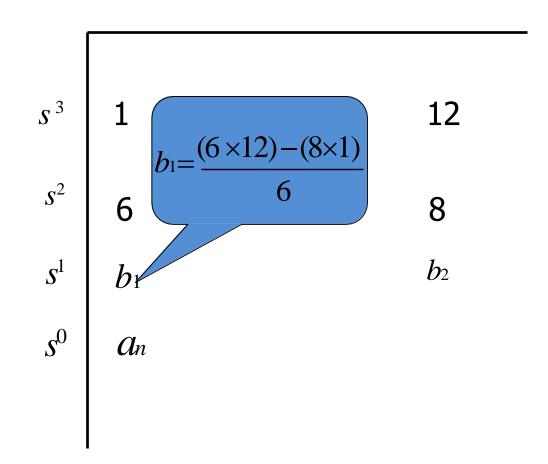

$$\int_{a_0}^{s^3} + 6s^2 + 12s + 8 = 0$$

$s^5$	1	4	2	
$s^5$ $s^4$	2	6	5	
$s^3$	1	-0.5		
$s^3$ $s^2$ $s^1$ $s^0$	7	5		
$s^1$	-1.21			
$s^0$	<b>A</b> n			

$$a_n = \frac{(5 \times -1.21) - (7 \times 0)}{-1.21}$$

$$a_n = 5$$

cont.....

$s^5$	1	4	2
$s^4$	2	6	5
$s^3$	1	-0.5	
$s^2$	7	5	
$s^1$	-1.21		
$s^0$	5		

There are two sign changes +7 to -1.21 and -1.21 to +5. Hence two roots are in RHP S-plane and system is unstable

Comment on stability. 
$$s^5 + s^4 + 2s^3 + 2s^2 + 3s + 5 = 0$$

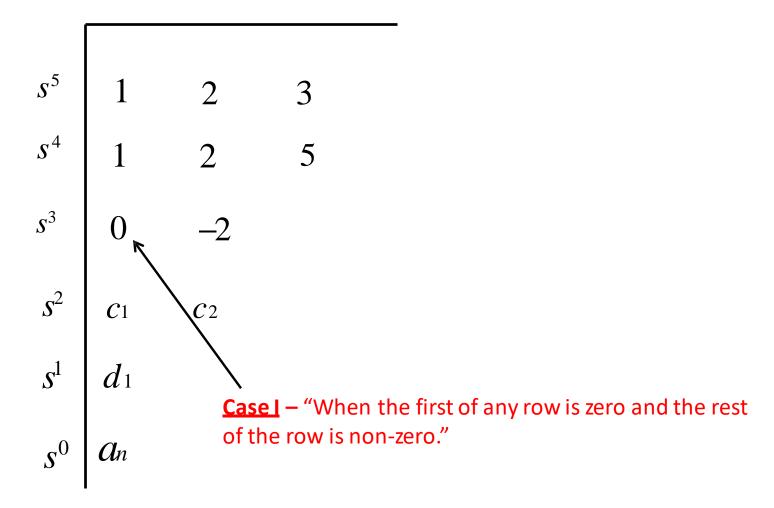

$$b_1 = \frac{(1 \times 2) - (2 \times 1)}{1}$$

$$b_1 = 0$$

$$b_2 = \frac{(1 \times 3) - (5 \times 1)}{1}$$

$$b_2 = -2$$

Comment on stability. 
$$s^5 + s^4 + 2s^3 + 2s^2 + 3s + 5 = 0$$

# **Routh's Criterion Special Cases**

Case I – "When the first of any row is zero and the rest of the row is non-zero." Here the next row cannot be formed as division by 0 will take place

Method to Overcome: A method to overcome above problem is to replace s by  $\frac{1}{z}$  and complete the Routh's test for z.

Replace s by (1/z)

$$\left(\frac{1}{z}\right)^5 + \left(\frac{1}{z}\right)^4 + 2\left(\frac{1}{z}\right)^3 + 2\left(\frac{1}{z}\right)^2 + 3\left(\frac{1}{z}\right) + 5 = 0$$

Take L.C.M

$$\frac{1+z+2z^2+2z^3+3z^4+5z^5}{z^5}=0$$

$$1+z+2z^2+2z^3+3z^4+5z^5=0$$

$$5z^5 + 3z^4 + 2z^3 + 2z^2 + z + 1 = 0$$

Use above characteristics equation and complete Routh's Test

$z^5$	5	2
$z^4$	3	2
$z^3$	$-\frac{4}{3}$	$-\frac{2}{3}$
$z^2$	$\frac{1}{2}$	1
$z^1$	2	
$z^0$	1	

There are two sign changes in first column.
Hence two roots are in RHP S-plane and system is unstable

Comment on stability.  $s^4 + 6s^3 + 11s^2 + 6s + 10 = 0$ 

$$s^4 + 6s^3 + 11s^2 + 6s + 10 = 0$$

$$s^{4}$$
 1 11 10  $b_{1} = \frac{(6 \times 11) - (6 \times 11) - (6 \times 11)}{6}$   
 $s^{3}$  6 6 0  $b_{1} = 10$   
 $s^{2}$   $b_{1}$   $b_{2}$   
 $s^{1}$   $c_{1}$   $b_{2} = \frac{(6 \times 10) - (6 \times 10)}{6}$   
 $s^{0}$   $a_{0}$   $b_{1} = 10$ 

$s^4$	1	11	10	
$s^3$	6	6	0	
$s^2$	10	10		
$s^2$ $s^1$ $s^0$	<b>C</b> 1			
$s^0$	<b>A</b> n			

$$c_1 = \frac{(10 \times 6) - (10 \times 6)}{10}$$

$$c_1 = 0$$

$s^4$	1	11	10	
$s^3$	6	6	0	
$s^2$	10	10		
$s^2$	0			
$s^0$	<b>A</b> n			

$$c_1 = \frac{(10 \times 6) - (10 \times 6)}{10}$$

$$c_1 = 0$$

<u>Case II</u> – "When all elements in any one row is zero."

# **Routh's Criterion Special Cases**

<u>Case II</u> – "When all elements in any one row is zero."

#### **Method to Overcome:**

- ✓ Here form an auxillary equation with the help of the coefficients of the coefficients of the row just above the row of zeros.
- ✓ Take the derivative of this equation and replace it's coefficients in the present row of zeros.
- ✓ Then proceed for Routh's test.

$S^4$	1	11	10	
$s^3$	6	6	0	
$s^2$	10	10		
$s^2$ $s^1$	0			
$s^0$	<b>A</b> n			

Here s<sup>1</sup> row breaks down. Hence write auxiliary equation for  $S^2$ .

$$A(s) = 10s^2 + 10$$

(Note each term of next column differs by degree of 2)

Take derivative of auxiliary equation

$$\frac{d}{ds}A(s) = 20s$$

Use these for s row coefficients. Dr. Anuj Jain

$s^4$	1	11	10	
$s^3$	6	6	0	
$s^2$ $s^1$ $s^0$	10	10		
$s^1$	20			
$s^0$	<b>A</b> n			

$$a_n = \frac{(20 \times 10) - (10 \times 0)}{20}$$

$$a_n = 10$$

$s^4$	1	11	10
$s^3$	6	6	0
$s^2$	10	10	
$s^1$	20		
$s^0$	10		

As no sign change in first column; system is stable

As no sign change in first column; system is stable

## **Application of Routh's Criterion**

√ The gain is kept in terms of k and Routh's array

is solved to find k for stable operation.

Determine the range of k for stable system.

$$s^4 + 5s^3 + 5s^2 + 4s + k = 0$$

$$\begin{vmatrix}
s^4 & 1 & 5 & k \\
s^3 & 5 & 4 & 0 \\
s^2 & 4.2 & k \\
s^1 & \frac{16.8-5k}{4.2} \\
s^0 & k
\end{vmatrix}$$

For stability all elements of first column 1 should be positive

i.e. 
$$k>0$$

For 
$$S^0$$
 row

and 
$$\frac{16.8 - 5k}{4.2} > 0$$
 For  $S^1$  row

i.e. 
$$16.8 > 5k$$
 or  $k < \frac{16.8}{5}$ 

Thus combining equations (1) and (2), 0 < k < 3.36

This is the range of k stable operation.

Determine the range of k for stable system.

$$s^4 + 4s^3 + 4s^2 + 3s + k = 0$$

$s^4$	1	4	k
$s^3$	4	3	0
$s^2$	$\frac{13}{4}$	k	
$s^1$	$\frac{39-16k}{13}$		
$s^0$	$\begin{vmatrix} k \end{vmatrix}$		

For stability,

i.e. 
$$k > 0$$
 and  $\frac{39 - 16k}{13} > 0$ 

i.e. 
$$39-16k>0$$
 or  $k<\frac{39}{16}$ 

$$k<2.43$$

Thus 
$$0 < k < 2.43$$

This is the range of k stable operation.

Determine the range of k for stable system.  $s^3 + s^2(2 + k) + 30sk + 200k = 0$ 

 $s^3$  1 30k

 $\int_{S^2} 2 + k$  200k

 $S^1 = \frac{30k(2+k)-200k}{(2+k)}$ 

 $s^0 \mid k$ 

#### For stability,

i.e. 
$$k>0$$

i.e. 
$$k+2>0$$

and 
$$\frac{30k(k+2)-200k}{2+k} > 0$$
  
  $k > 4.67$ 

Thus 
$$4.67 < k < \infty$$

This is the range of k stable operation.

## **Advantages of Routh's Criterion**

- ➤ It is a simple algebraic method to determine the stability of closed loop without solving for roots of higher order polynomial of the characteristics equation.
- > It is not tedious or time consuming.
- > It progress systematically.
- ➤ It is frequently used to determine the conditions of absolute & relative stability of a system.
- > It can determine range of k for stable operation.

## **Disadvantages of Routh's Criterion**

- ➤ It is valid only for real coefficients of characteristics equation. Any coefficient that is a complex number or contains exponential factors, the test fails.
- > It is applicable only to the linear systems.
- > Exact location of poles is not known.
- ➤ Only idea is obtained about stability. A method to stabilize the system is not suggested.

# Thank You
